Dear Hiring Team,

I am excited to apply for the Full Stack Engineer position within your engineering team. With more than six years of experience building production-ready software solutions, I am eager to contribute my technical expertise, product mindset, and passion for delivering high-quality digital products.

Throughout my career, I have developed production-ready SaaS platforms, enterprise applications, AI-powered solutions, e-commerce systems, marketplaces, ERP and CRM platforms, accounting software, booking systems, and business automation tools. I enjoy taking projects from concept to deployment, combining thoughtful software architecture with practical business understanding to create solutions that solve real-world problems.

My background is somewhat unique. Before becoming a software engineer, I spent several years working in logistics, supply chain management, and hospitality. Those experiences taught me how businesses operate, how teams collaborate, and how technology can improve efficiency. Today, I apply that operational perspective when designing software that is not only technically sound but also intuitive, scalable, and valuable for its users.

I am comfortable working across the full technology stack, including Next.js, React, TypeScript, Node.js, Supabase, PostgreSQL, REST APIs, Tailwind CSS, cloud deployment, authentication systems, and AI integrations. I enjoy continuously learning new technologies and adapting to modern engineering practices while maintaining a strong focus on clean architecture, performance, security, accessibility, and user experience.

Beyond writing code, I genuinely enjoy understanding business challenges, collaborating with stakeholders, and transforming ideas into reliable digital products. I take pride in delivering software that clients can depend on and continually improving both the products I build and the way I work as an engineer.

Over the past several years, I have independently designed, developed, and deployed complete software products used by real businesses, giving me experience that extends beyond coding into product thinking, architecture, and business problem solving.

I am open to international relocation and visa sponsorship and would welcome the opportunity to discuss how my experience, technical expertise, and passion for building high-quality software can contribute to your engineering team. Thank you very much for your time and consideration.

I appreciate your review of my application and hope to speak with you soon.

Yours sincerely,

Moganaden Cluthan
